

**INFANT SLEEP POSITIONER**

**ABSTRACT OF THE DISCLOSURE**

A sleep positioner comprises a body region having a top surface forming loop  
5 fasteners and first and second support cushions each having a flat bottom surface having at  
least one hook fastener. The support cushions are removably positionable on the top surface  
of the body region to form a space therebetween to receive and maintain an infant in a supine  
position. A support pillow extends from at least a portion of the body region and includes a  
cushion member having a support region, to support at least a portion of the head of the  
10 infant, at least partially surrounding a pressure relief region. The pressure relief region is  
configured to receive at least a portion of the back side of the head such that pressure applied  
to the back side of the head is reduced when lying in the supine position.
